## ABSTRACT

Let  $R$  be non-commutative ring with unity and  $n \geq p \geq 2$ ,  $p$  prime. S. A. Katre, Deepa Krishnamurthi proved that an  $n \times n$  matrix over  $R$  is the sum of  $p^{\text{th}}$  powers if and only if its trace can be written as a sum of  $p^{\text{th}}$  powers and commutators modulo  $pR$ . This extends the results of L. N. Vaserstein ( $p = 2$ ) and S. A. Katre, Kshipra Wadikar ( $p = 3$ ). Also S. A. Katre, Deepa Krishnamurthi obtained necessary and sufficient conditions for a matrix over  $R$  to be written as a sum of fourth powers when  $n \geq 2$ . In this paper, we obtain necessary and sufficient conditions for a matrix over  $R$  to be written as a sum of fifth powers when  $n \geq 3$ .

**Keywords :-** Matrices, non-commutative rings, trace, sums of powers, Waring's problem

## 1. INTRODUCTION

Carlitz showed as a solution to a problem proposed in Canadian Mathematical Bulletin that every  $2 \times 2$  integer matrix is a sum of at most 3 squares (see [1]). Initial work related to integer matrices and matrices over commutative rings as sums of squares can be found in [3, 8]. Wadikar and Katre [10] proved that every integer matrix is a sum of four cubes. Richman [6] studied Waring's problem for matrices over commutative rings as sums of  $k$ th powers. Katre and Garge [4] gave generalized trace condition for a matrix over a commutative ring to be a sum of  $k$ th powers. All our rings are associative. By a non-commutative ring, we mean a ring

with unity which is not necessarily commutative.

In this paper,  $R$  will be a non-commutative ring, and  $M_n(R)$  will denote the ring of  $n \times n$  matrices over  $R$ . For a non-commutative ring  $R$ , Vaserstein proved that a matrix of size  $n \geq 2$  over  $R$  is a sum of squares if and only if its trace is a sum of squares modulo  $2R$  (see [9]). Recently, Katre and Wadikar proved that a matrix of size  $n \geq 2$  over  $R$  is a sum of cubes if and only if its trace is a sum of cubes and commutators modulo  $3R$  (see [5]). In the context of Waring's problem for matrices, S. A. Katre, Deepa Krishnamurthi obtained a result for  $p^{\text{th}}$  powers when  $n \geq p \geq 2$ ,  $p$  prime and obtained an analogue of this result for

fourth powers for  $n \geq 2$  (see [7]). For both these results, they used the following general trace condition for a matrix over a non-commutative ring to be a sum of  $k$ th powers ([5], Theorem 3.2). Theorem (Katre, Wadikar): Let  $n, k \geq 2$  be integers and  $A \in M_n(R)$ .  $A$  is a sum of  $k$ th powers of matrices in  $M_n(R)$  if and only if  $\text{trace}(A)$  is a sum of traces of  $k$ th powers of matrices in  $M_n(R)$ .

In this paper, we obtain result for fifth powers for  $n \geq 3$ . For this result, we use the above general trace condition for a matrix over a non-commutative ring to be a sum of  $k$ th powers ([5], Theorem 3.2).

## 2. NOTATIONS

$E_{ij}$ : The  $n \times n$  matrix whose  $(i, j)$ <sup>th</sup> entry is 1 and other entries are 0.

$E'_{ij}$ : The  $p \times p$  matrix whose  $(i, j)$ <sup>th</sup> entry is 1 and other entries are 0.

$C(a_1, a_2, \dots, a_k) = a_1 a_2 \dots a_k + a_2 \dots a_k a_1 + \dots + a_k a_1 a_2 \dots a_{k-1}$  where  $a_1, a_2, \dots, a_k \in R$ , is called a cyclic sum of length  $k$  and  $[x, y] = xy - yx$  is called the commutator of  $x$  and  $y$ .

Note that  $-C(a_1, a_2, \dots, a_k) = C(-a_1, a_2, \dots, a_k)$  is a cyclic sum and  $-[x, y] = [-x, y]$  commutator.

## 3. MAIN RESULT

In the case of  $p$ <sup>th</sup> powers, we required to show in our proof that a cyclic sum  $C(a_1, a_2, \dots, a_p)$  is in  $T_p$ . For this, we showed that  $C(a_1, a_2, \dots, a_p) = \text{trace}(F^p)$ , where  $F$  is a  $p \times p$  matrix. Because of this our proof required  $n \geq p$ . We shall see in the next section that for fifth powers we can make use of the five entries in a  $3 \times 3$  matrix to show that  $C(a, b, c, d, e) \in T_5$ . This will give us a criterion for  $A \in M_n(R)$  to be a sum of fifth powers for  $n \geq 3$ .

The following theorem gives a non-commutative version of Theorem 2.3, 2.6 in [2].

**Theorem:** Let  $n \geq 3$  be an integer and let  $T_5 = T_{\{5, n\}}$  be set of those elements of  $R$  that can be expressed as sums of traces of fifth powers of  $n \times n$  matrices over  $R$ . For  $a, b, c, d, e \in R$ , Let  $C(a, b, c, d, e) = abcde + bcdea + cdeab + deabc + eabcd$ . Then

- (i) For  $a, b, c, d, e \in R$ ,  $C(a, b, c, d, e) \in T_5$ . Also  $5a, a^5 \in T_5$ .
- (ii)  $T_5 = \{ \sum_{j=1}^q C(a_j, b_j, c_j, d_j, e_j) + \sum_{j=1}^l g_j^5 / a_j, b_j, c_j, d_j, e_j, g_j \in R, q, l \geq 1 \}$ .
- (iii)  $T_5 = \{ \sum_{j=1}^q (a_j b_j - b_j a_j) + \sum_{j=1}^l c_j^5 + 5r / a_j, b_j, c_j, r \in R, q, l \geq 1 \}$ .
- (iv) A matrix  $A \in M_n(R)$  is a sum of fifth powers if and only if  $\text{trace}(A)$  is a sum of fifth powers and commutators modulo  $5R$ .
- (v) A matrix  $A$  in  $M_n(R)$  is a sum of fifth powers if and only if  $\text{trace}(A) = x_0^5 + 5x_1^5 +$  a sum of commutators where  $x_0, x_1 \in R$ .

### Proof:

(i) For the  $3 \times 3$  matrix  $E'_{ij}$ , and the zero matrix  $O_{n-3}$  of order  $n-3$ , let  $a, b, c, d, e \in R$ ,

$$N_1 = \begin{bmatrix} a & 0 & b \\ e & d & 0 \\ 0 & c & 0 \end{bmatrix}, N_2 = \begin{bmatrix} a & 0 & b \\ -e & 0 & 0 \\ 0 & c & 0 \end{bmatrix}, N_3 = \begin{bmatrix} 0 & 0 & b \\ -e & d & 0 \\ 0 & c & 0 \end{bmatrix}, N_4 = \begin{bmatrix} -a & 0 & 0 \\ 0 & -a & 0 \\ 0 & 0 & 0 \end{bmatrix}, N_5 = \begin{bmatrix} -d & 0 & 0 \\ 0 & -d & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

We have,  $\text{trace} \sum_{i=1}^5 N_i^5 = [C(a, b, c, d, e) + a^5 + d^5 + (bcea + aabce + eaabc + ceaab + abcea) + (bcdde + ebcdd + ddebc + cddeb + debcd)] + [a^5 - bcea - aabce - eaabc - ceaab - abcea] + [d^5 -$

$bcdd - ebcdd - ddebc - cddeb - debcd] - 2a^5 - 2d^5 = C(a, b, c, d, e).$

Hence,  $C(a, b, c, d, e) \in T_5$ . Also  $C(a, 1, 1, 1, 1) = 5a$ , hence  $5a \in T_5$ . Also  $a^5 = \text{trace}(aE_{11}^5) \in T_5$ .

(ii) From (i),  $C(a_j, b_j, c_j, d_j, e_j) \in T_5$ , also  $g_j^5 \in T_5$ . Thus, every element of R.H.S. of (ii)  $\in T_5$ .

Conversely, for  $A \in M_n(R)$ , trace of  $A^5$  is sum of fifth powers of diagonal entries and entries

of the type  $C(a, b, c, d, e)$ , so  $T_5 \subseteq$  R.H.S of (ii).

(iii) By (i), every term in the elements of R.H.S. of (iii)  $\in T_5$ , so R.H.S. of (iii)  $\subseteq T_5$  and

conversely by (ii),  $T_5 \subseteq$  R.H.S. of (iii).

(iv) A matrix  $A \in M_n(R)$  is a sum of fifth powers if and only if trace of  $A$  is a sum of traces of fifth powers of matrices in  $M_n(R)$  if and only if, by (iii),  $\text{trace}(A)$  is a sum of fifth powers and commutators modulo  $5R$ .

(v) By (iv),  $A$  in  $M_n(R)$  is sum of fifth powers if and only if  $\text{trace}(A)$  is a sum of fifth powers and sum of commutators modulo  $5R$ .

$$\begin{aligned} \text{Now Consider, } a^5 + b^5 &= (a+b)^5 - (a^4b^1a^0 + a^3b^1a^1 + a^2b^1a^2 + a^1b^1a^3 + a^0b^1a^4) - (b^4a^1b^0 \\ &+ b^3a^1b^1 + b^2a^1b^2 + b^1a^1b^3 + b^0a^1b^4) - (b^3a^2b^0 \\ &+ b^2a^2b^1 + b^1a^2b^2 + b^0a^2b^3 + b^4a^2b^4) - \\ &(a^3b^2a^0 + a^2b^2a^1 + a^1b^2a^2 + a^0b^2a^3 + a^4b^2a^4) \\ &= (a+b)^5 - (a^4b^1a^0 + a^0b^1a^4 + a^3b^1a^1 + a^1b^1a^3 \\ &+ a^2b^1a^2) - (b^4a^1b^0 + b^0a^1b^4 + b^3a^1b^1 + \\ &b^1a^1b^3 \\ &+ b^2a^1b^2) - (b^3a^2b^0 + b^0a^2b^3 + b^2a^2b^1 + b^1a^2b^2 \\ &+ b^4a^2b^4) - (a^3b^2a^0 + a^0b^2a^3 + a^2b^2a^1 + a^1b^2a^2 \\ &+ a^4b^2a^4) \end{aligned}$$

$= (a+b)^5$ - cyclic sums

Since every cyclic sum is sum of commutators modulo  $5R$ , we get  $a^5 + b^5 = (a+b)^5 +$  sum of commutators modulo  $5R$ .

Note:  $T_5$  is independent of  $n$  for  $n \geq 3$ .
